Abstract (en)  
[origin: EP1411345A1] Fluorimetric parallel analysis of biochemical samples involves detection of laser-induced fluorescence, followed by extraction of time-resolved multi-parameter information about sample : Fluorimetric parallel analysis of biochemical samples involves splitting a collimated primary laser beam (101) with a beam splitter (102) into at least two collimated secondary laser beams (103), deflecting the beams such that they propagate at different angles with respect to optical axis of focussing optic (109), detecting light emitted from volume elements (108) with a detector set (110) and evaluating the detected light. An independent claim is also included for a device for analyzing properties of a sample.
