Abstract (en)
[origin: EP1411439A2] A playback apparatus that is used for receiving and continuously playing back a plurality of video sources delivered via a network. Video sources V_m continuously played back in content and the display time of the video sources V_m are extracted from playback information described in a playback scenario read into a scenario management section via the network. The video sources V_m are rearranged in order of display time. The distribution of the video sources V_m among a plurality of decoder modules D_n, a playback schedule, and a schedule of switching a changeover switch are determined. By doing so, the plurality of video sources V_m are continuously played back.
[origin: EP1411439A2] A management unit reads playback scenario describing video playback information and provides read playback scenario to requesting communication unit. The communication unit selectively receives the decoded video information from decoder and output the information according to playback scenario. Independent claims are also included for the following: (1) playback method; (2) playback program; and (3) computer readable medium storing playback program.
