Abstract (en)

[origin: WO03014447A1] The invention relates to a woven belt for a paper machine, especially for a corrugated cardboard machine. Said belt (1, 2, 3) comprises a first fabric layer (20, 60, 80) that absorbs the tensile forces and that consists of warp threads (21, 22; 61, 62, 63, 64; 81, 82, 83, 84) and woof threads (4; 6; 8), and an additional, upper fabric layer (10; 50; 70) that covers the first fabric layer (20; 60; 80) and that consists of warp threads (11, 12, 13, 14; 51, 52, 53, 54; 71, 72, 73, 74) and woof threads (4) and shapes the upper face of the paper. The fabric layers (10, 20; 50, 60; 70, 80) are interwoven by means of binding threads (40, 41, 42, 43; 44, 45; 46, 47). In order to allow for the provision of a belt that has a mechanically solid structure and is yet highly permeable, the belt (1; 2; 3) is provided with drainage channels (50) that extend at least partially through the belt and through which the vapor from the upper fabric layer (10; 50; 70) can be removed from the surface of the paper.
