Abstract (en)

[origin: WO03013730A1] A connector (10) useful for combining the contents of a pair of containers which includes a hollow body (11) for passing fluids between the containers. The body (11) includes top (12) and bottom (13) end portions dimensioned to receive open-ended containers in an interference fit. The top end portion (12) includes one or more recesses (27) sized and arranged to facilitate drainage of a fluid from the first container into the second container when the first container is positioned above the second container. A middle portion (14) is positioned between and adjoins the end portions of the body (11). A system for combining the contents of a pair of containers is formed when containers having substances to be combined are fitted onto the end portions (12, 13) of the connector (10).
