Abstract (en)  
[origin: WO03014008A1] The aim of the invention is to configure a saddle backing (1) for a riding animal that is as anatomically compatible as possible. To achieve this, two lateral sections (3), e.g. consisting of lambskin (7) are interconnected by means of a web element (4), in which a recess (6) in the shape of a longitudinal groove is fashioned, said recess extending along the vertebral column (5) of the riding animal, in such a way that no pressure is exerted on said vertebral column (5). The weight of a rider is thus distributed over a large surface area on the lateral sections (3) lying on the flanks of the riding animal.
