Abstract (en)
[origin: WO03014382A2] The invention relates to a device for analyzing at least one analyte from a sample. The inventive device comprises a support (1) with a surface (2) on which at least one predefined analytical zone (3) and at least one predefined control zone (4) are arranged. At least one first binding partner which specifically binds to at least one analyte is immobilized in the predefined analytical zone (3). At least one further binding partner is disposed in the at least one control zone (4) and allows at least one control for determining the quality of analysis.
