Abstract (en)

[origin: FR2828625A1] The invention relates to a system of managing access from a mobile terminal (10) to a communication network (40, 41, 42, 40', 41 " 42', 62) via a mobile network. According to the invention, the connection to said communication network (62) is established by a piece of access management equipment (61) which manages a name identifying said communication network (62). The system comprises at least one identifier name server (70), of the operator to which the mobile terminal (10) is subscribed, which can: analyse at least one identifier name originating from the mobile terminal (10); recognise the geographical area in which the mobile terminal (10) is located; search for a mobile network (60) that provides access to said communication network (62) in the known geographical area; and recognise the access management equipment (61) that can be used to establish the connection with said communication network (62) in the known geographical area. The invention is suitable for managing access to a communication network offering a group of services from a mobile terminal (10) which is located in a public mobile network that is managed by an operator different from that to which the user is subscribed.

[origin: FR2828625A1] The mobile terminal access management system has a communications network (40,41,42) with the mobile terminal (10) wishing to communicate in a different geographic zone to that to which it subscribes. The network connection (62) is established by access management (61) equipment towards a name identified network. There is a server (70) providing the identifier name and adapted to recognize the mobile telephone geographic zone, so that it is recognized by the access management and network connection can be made.
