Abstract (en)

The invention relates to a method for the production of a liner for a wall panel or roof panel, the liner being present at the interior side of the panel during use, in which a plate is formed such that one edge of the plate is formed into a male portion and the opposite edge is formed into a mating female portion, the male and female portions being connected by a substantially flat portion. <??>According to the invention, the female portion is formed with an extension such that the extension protrudes in a direction away from the substantially flat portion when the liner is to be used for a roof panel, and the female portion is formed with an extension such that the extension is substantially parallel to the substantially flat portion when the liner is to be used for a wall panel. <??>The invention also relates to liners formed by using this method and panels formed with these liners.
