Abstract (en)
[origin: WO03012208A2] The barrier comprises a number of modular units, which are arranged one behind the other so that their longitudinal axes A lie in a row one behind the other on a common straight line. Rows of this type that are comprised of modular units (100) run parallel to one another and are arranged side-by-side and/or one above the other, whereby these rows form a packet. One such row is arranged opposite another row, whereby the transition points between the end parts (102, 103) of two modular units (100) which are located directly behind one another or one atop the other are located within the length (LA) of one of the modular units (100) of the adjacent row so that the modular units (100) in the adjacent rows are offset in relation to one another in their longitudinal direction and partially overlap.
