Abstract (en)

[origin: WO03017560A1] A wireless communications system method and apparatus transmits packet data at a first rate (R1) selected to provide an acceptable packet error rate (PER) for a given wireless channel. Upon receipt of a request for retransmission of a data packet, the method and apparatus switch to a second rate (R2), lower than the first rate, for retransmitting the data packet. The overall transmission rate becomes $R1/(1+PER1R1/R2)$, which is only slightly lower than that of the single rate retransmission $R1/(1+PER1)$, but the resulting $PER=PER1PER2$ is much smaller than $PER1<2>$ for the case of single rate retransmission.
