Abstract (en)

The present invention relates to systems and methods for distributing control information such as event notifications and status in a substantially real time manner. Such information can be provided in a parallel and concurrent manner to many locations/devices and/or users. In addition, multi-directional network communications are provided to facilitate system diagnosis, status, and troubleshooting among various parties and/or devices. In one aspect of the present invention, messaging components may be installed on local control components and remote diagnostic equipment that communicate across a network such as the Internet. If an event is detected, various parties can be contacted by the control components, wherein the parties may communicate in a concurrent manner while receiving control information from the control components. In this manner, diagnosis, troubleshooting, and/or routine maintenance can be performed collaboratively between various control components and remote systems/parties interacting therewith. <IMAGE>
