Abstract (en)
[origin: WO03016564A2] The invention relates to the use of a probe or a nucleotide primer in a method of selecting plants having improved phenotypic seed quality characteristics for the detection of a polymorphic base or a polymorphic nucleotide sequence that defines an allele of a polymorphic site of the Sh2 gene of sequence SEQ ID N DEG 1. Said polymorphic base or said polymorphic nucleotide sequence is contained in a nucleic acid included in an Sh2 gene. The invention can be used to obtain transformed plants that can produce seeds having improved agri-food or industrial qualities.
