Abstract (en)
[origin: EP1289201A1] The process determines and sets-up a route between requesting/offering first network station (N1) and responding last station (N9) in an ad hoc network. The first network station transmits corresp. information to adjacent stations (N2-4), which forward the information. Then follows routing from station to station. Each station (N1-9) transmits the information as its own and stores the respective data of received and forwarded information for later arriving information, or data packets. Independent claims are included for network stations.
