Abstract (en)

[origin: WO03024147A2] The invention provides a system and method for enabling DRR that supports multiple, simultaneous voice call events. In addition the invention provides for DRR that support the activation and deactivation of bit synchronous PCM timeslots within a well-defined period of time (e.g., not to exceed 100 ms) that can accomodate any voice call control signaling procedures, DRR that provides for robust communication of the DRR signaling protocol between the line terminal (LT) and the network terminal (NT), DRR that supports periodically refreshing the status of the bit synchronous PCM timeslots and DRR that aligns with proposed DSL bearer requirements.
