Abstract (en)
Door-opening device (1) comprises a drive (2) connected to a linear transmission (7) that is connected to a force-transfer element at least indirectly connected to the door. Preferred Features: A connecting element (20) arranged between the transmission and the force-transfer element consists of a drive-side connecting body and a door-side connecting body that move toward each other. The two connecting bodies are coupled to each other during operation of the drive in favor of a force flow from the drive to the force-transfer element. The two connecting bodies are brought into an uncoupled position by a force flow from the force-transfer element to the drive.

Abstract (de)
Die Erfindung bezieht sich auf einen Türöffner, mit einem Antrieb, einem damit verbundenen Getriebe und einem mit dem Getriebe verbundenen Kraftübertragungselement, das zumindest mittelbar mit der zu betätigenden Tür verbunden ist, wobei das Getriebe als Lineargetriebe ausgebildet ist.
