Abstract (en)
[origin: WO03026851A1] A door dressing tool has an elongate flat blade (1) with abrasive particles (3) secured to a carrier strip (31) which is bonded to the blade by a pressure-sensitive adhesive (32). A moulded support member (2) is provided at one end of the blade for supporting said end in use such that when the tool is placed on a floor the support member holds one end of the blade above the floor. The blade is formed of springy material such that when a door is swung on its hinges to move over the blade the blade exerts a continuous upward pressure on the bottom of the door to abrade material from the door. The carrier strip can be peeled off the blade, and strips having different grades of abrasive may be provided.
