Abstract (en)
[origin: WO03029083A1] The invention concerns an article labelling station, in particular for bottles, wherein the labels of removal elements driven in rotation on a rotating support are glued with surfaces for positioning labels curved outwards, and are transferred onto a label transferring cylinder. The driving means consist of a cam type transmission formed by three single-effect stationary superimposed cams, and engagement members, engaged therewith, and mounted in a support element (25) on a drive shaft (8) of the removal element. In order to obtain a support element least likely to be deformed, capable of being produced with precision, the support element comprises a component with S-shaped cross-section, whereon each individual engagement member is directly maintained.
