Abstract (en)  
[origin: WO03029588A1] The invention relates to a switchgear cabinet comprising a double-leaf door with a first and a second door leaf, said door leaves are hung on the exterior of the carcass and overlap when closed. The cabinet also comprises a locking device, which locks both door leaves to a floor and/or cover transverse part of the switchgear cabinet by means of a sliding bar that runs parallel to a vertical edge of one of the door leaves. The overlapping areas of the door leaves are bent in such a way that they form a substantially right-angled channel, in which the displaceable sliding bar is housed and that a respective receiving part (8), which extends beyond the carcass is provided on the cover and/or floor transverse part.
