Abstract (en)

[origin: DE10260758B3] The device has sheet holding systems associated with drum base body regions and with a carrier body rotatably mounted relative to the drum body for adjusting the sheet holding systems in the peripheral direction. An axially movable actuating element transferring a linear actuation motion forms the drive element of a gearbox with which the linear actuation motion can be converted into a rotary motion of the carrier body as gearbox output element. The device has sheet holding systems (9) associated with regions of a drum base body (11) and with a carrier body rotatably mounted relative to the drum base body for adjustment of the sheet holding systems in the peripheral direction. An axially movable actuating element (15) transferring a linear actuation motion forms the drive element of a gearbox with which the linear actuation motion can be converted into a rotary motion of the carrier body forming the gearbox output element.
