Abstract (en)
[origin: WO03028517A2] The invention relates to a device for aspirating particles to be collected, in which at least one collecting compartment (SR) for collecting these particles is connected via an inlet opening of a partition (TW) to aspirating means (MO, GB) located inside at least one accommodating compartment (MR). The collecting compartment is connected to the aspirating means in a manner that enables an airflow (LF) to be guided from the collecting compartment (SR) to the aspirating means (MO, GB). The partition (TW) comprises, as an inlet opening, an air guiding rectifier (LT) whose inlet surface forms a significant portion of the partition surface (TW).
