Abstract (en)
With conventional small troublesome indexable inserts from high-pressure sintered materials having neither a screw-hole nor a cavity for attaching the insert to a toolholder, clamping the insert onto the holder has been complicated and the tightening force has been weak. The cause behind this is that with the hardness of high-pressure sintered material being high, surface machining is extremely difficult. <??>A toolholder attachment cavity is provided in the rake face of an indexable insert composed of a high-pressure sintered material, by machining with a laser whose light output power is adjusted and whose light-harvesting is enhanced using a galvanometer mirror, while high-precision controlling the beaming position. This allows small-scale indexable insert of high-pressure sintered material to be mounted onto a holder simply and securely with a clamp, and makes for curtailed prep time, improved machining precision, and better mounting reliability. <IMAGE>
