Abstract (en)
[origin: WO02089734A2] 2-aminobenzenesulfonamide derivatives are used for the treatment or prevention of the disturbances of the central nervous system associated with a positive or negative modulation of glutamatergic neurotransmission, such as disturbances of memory and learning, schizophrenia, sexual disturbances, ischemic attacks, ictus, etc. For example, a compound according to formula (I): is administered to treat or prevent diseases of the central nervous system having a positive or negative modulation of AMPA/Kainate receptors and a negative modulation of NMDA receptors.
