Abstract (en)
[origin: WO03033851A1] The invention concerns a fixing element for plate-shaped cladding panels, in particular glass panes in the form of single glazing such as spaced apart panes for insulating double glazing. The glass panes (11) are placed at some distance from each other and are juxtaposed by means of a peripheral joint. The edges (13) of the glass panes (11) have in particular a bevel, groove or slide with which the fixing element (1) co-operates. The invention is characterized in that the fixing element (1) has a central element (2) and at least two pane-fixing elements (3) which are respectively in contact with the edge (13) of the glass pane (11) associated with the fixing element and at least one pane-fixing element (3) is mobile independently of the other relative to the central element (2) and can be fixed at each point of the displacement path. The invention also concerns designs corresponding to different possibilities for displacing, rotating and mounting the pane-fixing element.
