Abstract (en)
[origin: FR2829535A1] The pump comprises a body (1) having a cylindrical cavity (2) in which a movable ring (3) displaces radially and inside which is a hub (4), able to rotate around a fixed axis, provided with blades (5) which during rotation are supported against the internal surface of the ring. The ring can be displaced between a position centered on the rotational axis and an end position eccentric to the hub rotational axis. The ring displacement means comprise a hollowed out part (10) in the cylindrical wall of the body cavity and a projection (9) on the ring external face which slides in the hollowed out part to form a chamber in which a pressure is applied dependent upon the pressure existing in the pump pressure zone.
