Abstract (en)

[origin: EP1439495A1] A system for validating an electronic ticket includes i) receiving means (263) for receiving an electronic ticket, the electronic ticket including a first identifier (TUID1) and a second identifier (NONCE'), ii) a ticket storage (230) for storing the electronic ticket, iii) secure storing means (252) for storing the first identifier (TUID), and iv) validating means (280) adapted to store the first identifier (TUID) to the secure storing means (252) when the electronic ticket is validated. An electronic ticket (300) has a sealed state and a validated state, wherein the state of the electronic ticket (300) is defined by the public part (300PU) or private part (300PR) of the electronic ticket (300), in such a manner that whenever the private part (300PR) corresponds to a valid value, the electronic ticket (300) is in the validated state. <IMAGE>
