Abstract (en)
[origin: WO03038171A1] The invention relates to a yarn processing system, comprising a yarn feeder (F), a textile machine (M), an at least adjustable tension device (B) and a tension meter, which senses the yarn downstream of said tension device, for at least measuring the yarn tension (g). According to said invention, the tension meter (T) is permanently arranged within the yarn path, can be adjusted between a passive position (I) and at least one detection position (II, III) and can be optionally readjusted from said detection position (II, III) to the passive position (I) after a number of weft cycles, which represents at least the adjustment of a yarn tension set profile.
