Abstract (en)
[origin: WO03036006A1] The invention concerns a lock equipped with a bolt mobile between an opening position and a closing position by a control element. Said control element is associated with a lifting magnet. Said magnet locks the control element in closing position with a locking element and moves the locking element to release the closure, from the closing position to the opening position. The invention aims at enhancing the reliability of the closing process of such a lock while enabling a simple construction. Therefor, the lifting magnet is associated with an actuating part, the actuating part comprises a projection which can be actuated by the actuating part and the actuating part releases the lifting magnet from the opening position with the projection.
