Abstract (en)

A turn-tilt mechanism for windows of extraordinarily small width of the order of 25-35 cm that are not capable to receive mechanisms of the prior art. The achievement of the proposed mechanism is the elimination of the previously employed connection bars of the scissor to the slotted angle bend of the mechanism. The mechanism comprises a slotted angle bend (1) within which moves a motion transmitting steel strap assembly (8) for transferring the movement of an operating handle (27) to the mechanism, an L-shaped end flat metal bar (2) connected to an upper hinge (24) of pivotal connection of the window casement and a link scissor member (3) associated with a supplementary arm (7) for the connection of angle bend (1) and end flat metal bar (2), where member (3) moves so as to alternatively bring parts (1,2) in alignment providing for the window turning operation or set them at an angle providing for window tilting. <IMAGE>
