Abstract (en)
[origin: WO03039681A1] A fall-arrest system is designed for convenient attachment and/or removal relative to a support structure. The system includes a safety line and line supporting brackets that cooperate to support and facilitate passage of a coupling device along the safety line. The system also includes base members that are secured to the support structure and adapted for convenient installation and removal of the line supporting brackets relative thereto. The base members are relatively inexpensive parts that may be left in place on the support structure upon completion of a project, whereas the relatively more expensive line supporting brackets and safety line may be removed for use at other sites.
