Abstract (en)

[origin: CA2466609A1] The invention relates to a plastic insert for inserting into an opening of a container part and for connecting thereto. Said plastic insert is comprised of a base body (1), which contains a through passage (2) with opposite axial opening ends (3, 4), of at least one connecting rib (5) that protrudes from the base body along the outer periphery, and of a distributing system, which is shaped onto the base body near one of the axial opening ends of the through passage and which has at least one distributing brace (10) that transversally spans the opening end at a distance and in the path of a fluid stream exiting from the opening end. The distributing brace (10) can be pivoted between the position that spans the opening end (3) of the through passage (2) and a position that does not span the opening end of the through passage. A blocking wall (7) that can be torn away can be integrally shaped onto the base body (1) via a peripheral thin location (8) in order to hermetically seal the through passage (2) before the first-time use of the insert.
