Abstract (en)

[origin: EP1445385A1] A connecting device for tools is provided with a first member (2) and a second member (3) fit to be fixed to a tool (100) and to a support (101) that, in an operational condition, they transmit to each other strength mainly oriented in a strength direction (S). <??>The device (1) includes at least a arrest mean (7) associated to one of the members (2, 3) and sliding in comparison to this latter in a sliding direction (D) tilted in comparison to the average strength direction (S), to detachably engage, in a linking condition (C), at least a respective housing mean (9) of the remaining member (3, 2). Said arrest mean (7) being provided with at least a wedge surface (10) tilted in comparison with its sliding direction (D) and fit, in the linking condition (C), to match at least a corresponding second flat surface (11) of the housing mean (9). <IMAGE>
