Abstract (en)

[origin: WO03043707A1] The invention relates to an arrangement for a ski binding which can be positioned on a ski, said binding consisting of two parts: a front jaw and a heel holder which can be moved in a sliding manner in the longitudinal direction of the ski in guiding mechanisms which are fixed to the ski, and are connected by means of a connecting element (1) extending in the longitudinal direction of the ski. At least the position of one of the parts of the ski binding can be adjusted in relation to the connecting element (1), and the connecting element (1) can be fixed in relation to the ski. The mutual position of the front jaw and the heel holder can be self-adjusted and fixed on the connecting element (1) in such a way that the front jaw and the heel holder form, together with the connecting element (1), a pre-assembled unit which is separate from the ski, and can be slid along the guiding mechanisms which are fixed to the ski.
