Abstract (en)

[origin: EP1447219A1] Rotary tampon printer has at least one carrier device (5) with a number of retainers (6) in which objects to be printed are placed and one or more print modules (A-C), with which the objects can be printed. The carrier device is driven by a first drive, while the print modules are driven using a second high-dynamic drive that controls the print modules so that they are independently positioned relative to objects to be printed. An independent claim is made for a method for printing objects with at least a print module.
