Abstract (en)
[origin: WO03029105A1] The invention relates to a fluid product dispensing device comprising: a product vessel (10); a pump (20) which is mounted on said vessel (10) for the selective delivery of the product; and a distributor head (30) which is connected to said pump and which comprises a port (31). The inventive device is characterised in that it comprises at least two lateral actuation elements (40, 50) which are disposed around the distributor head (30). The lateral actuation elements (40, 50) are moved simultaneously in a direction that is more or less transverse to the central axis of the device and each of said elements co-operates with a peripheral edge (11) of the vessel (10) in order to exert an axial force thereon.
