Abstract (en)  
[origin: EP1312847A1] A sleeve (1) which can house at least a portion (2) of a cable or a pipe (4) comprises an internally hollow body (6) having at least one flexible portion (22) which can be clamped around the said portion of the cable or pipe, and a sealing element (26) provided in the region of the flexible portion of the sleeve body and deformable together therewith. The sleeve (1) can be associated with a clamping ring nut (100) which can deform the assembly formed by the flexible portion (22) of the sleeve body and the sealing element (26) onto the portion of the cable or of the pipe which is housed in the sleeve body (1). The sleeve (1) is characterized in that the flexible portion (22) of the sleeve body is at least partially embedded in the sealing element (26), forming means for fixing and at the same time sealing between the cable and the sleeve, which means are particularly resistant to wear due to the action of the ring nut (100) and can be reused several times since they are not permanently deformable.
