Abstract (en)
[origin: EP1449455A1] The key case has an insertion socket (3) with an attachment unit (5) that cooperates with a retention unit (7). The retention unit is hidden to allow the passage of the attachment unit, when a key insertion (4) is introduced in the socket through an insertion opening (6), and is projected after passing the insertion through the opening, to prevent the insertion coming back from the socket. The attachment unit is fixed at a rear end of an insertion socket to allow the movement of key insertion between a retracted position in which the insertion is hidden in the socket and a deployed position in which the insertion is withdrawn from the socket.
