Abstract (en)

[origin: EP0906975A1] The bundle of fibrils is transferred from one roller of the stretching roller pair (1a,b), to the texturing unit. They are led from this roller without deflection, directly up to and into the conveying section, which includes the conveying fluid distribution nozzles (13). An Independent claim is included for the texturing section of the machine, where the texturing nozzles (8) have a fan-shaped arrangement. Preferred features: Each individual texturing nozzle is aligned with its axis along the conveying direction of the bundle it propels. Each bundle leaves the delivery roller (1a) at a departure point (15), and runs literally straight, into its coaxial texturing nozzle (8).
