Abstract (en)
[origin: WO03048626A1] The invention relates to a half-shell of a holder for elongated objects (7), particularly tubes or cable harnesses, comprising a spring structure (2), which is fastened to a half-shell (1) on the interior thereof and provided for establishing a non-positive connection to the object (7). The invention is characterized in that the half-shell (1) comprises a spring structure (2) having a spring characteristic with a bent progression. The invention particularly relates to a half-shell (1) with an outer shell (4) and with a spring structure, which is fastened to the half-shell (1) on the interior thereof and provided for establishing a non-positive connection to the object (7) that is formed by an inner shell (3). The inner shell (3) comprises at least one first bridge-like arch (5), which spans an inner space (15) and can freely move outward, and comprises at least one second bridge-like arch (6) arranged next to the first arch (5) in the longitudinal direction with regard to the objects (7) to be fastened. The first arch (5) leaves a smaller inner area (8) open than the second arch (6), and the second arch (6) rests via its exterior against the outer shell (4). The inventive half-shell (1) is capable of securely holding different objects (7) of greatly varying diameters without damaging them.
