Abstract (en)

[origin: WO03034294A2] The invention relates to a data processing system for processing patient data, which include personal identification data of a particular patient and corresponding health data (GD). Said data processing system comprises a central station (3), which contains a data bank (4) storing said health data and terminals (1), which are connected to the central station for calling in health data from said data bank and/or memorizing health data into the central data bank. According to the present invention, said health data are stored in the central data bank without allocation to personal data. A record identification code (DIC) is allocated to the health record of a particular patient, the code input being necessary for calling in said health record. The present invention also relates to the use of said data processing system for example in a system using electronic patient records.
