Abstract (en)  
[origin: WO03052893A2] The invention relates to a bushing (1) for supporting electric conductors. Said bushing contains a flange section (2), a corrugated section (3), which projects above the flange section in the longitudinal direction of the electric conductor, in addition to at least one retaining section (4), which has bushing orifices (7) that are open on both sides for receiving busbars. The aim of the invention is to reduce the production costs and simplify the assembly of a bushing of this type. To achieve this, the bushing (1) is configured in one-piece, each retaining section (4) being solely supported on the flange section (2) by means of the corrugated section (3).
