Abstract (en)

[origin: WO03054275A1] The invention relates to a drum (1), which is mounted to rotate within the housing of a linen processing machine, preferably a washing machine. Said drum comprises at least one bottom disc (3) as well as a shell (5). Both components are each at least partially made of sheet steel and one of said components or both have a domed structure directed toward the inside of the drum. The aim of said invention is to increase the rigidity of said components (3) and (5), in order to improve the draining capacity thereof and increase the look-and-feel thereof. Said aim is achieved, whereby the domed structure is formed from spherical caps (6) directed toward the inside of said drum.
