Abstract (en)
[origin: WO03054896A1] The invention relates to an electromechanical switch. In order to simplify and reduce the production costs of a push-button switch, especially a push switch or a rocker switch, said switch has time functions, is manually operated and can be reset by an electric pulse. The inventive electromechanical rocker or push-button switch can be combined to form a device block switch with other rocker or push-button switches as usually used in exhauster hoods. As a result, time-controlled intensive and follow-up steps can be carried out.
