Abstract (en)
From a handle (7-8) firmly attached by the free ends (9) of its side legs to a ring (1) for coupling to the flask neck, the invention is centered on the fact that a large end sector (10) of the side legs (8) of the handle adopts a curved trajectory with a curvature equal to that of the ring (1), to which it is adapted along its entire length and attached by a weakened line (11) that is easily torn in the manual use of the handle (6), even due to the weight of the flask, these large areas of attachment of the handle, firm (9) and provisional (11), ensuring that the overhanging part of the handle remains coplanar to the attachment ring during the manipulation of the handle in an assembly chain. <IMAGE>
