Abstract (en)
[origin: WO03046271A1] The present invention relates to a method for determining the unbalanced load in the domestic appliances, preferably those of the front-loading type, for increasing the capacity of the total load and when the speeds exceed the high revolutions, comprises the discharging (100), distribution (200), prespinning (300) and spinning (400) cycles and which enables the selection of spinning profiles that are suitable to the unbalanced loads (DY) obtained by precise unbalanced load measurement depending on the balanced load by interpreting the data received from the motor, according to the experimental data recorded in the data storage unit.
