Abstract (en)
[origin: EP1326395A1] The invention relates to a method for displaying data on a telecommunications terminal (TKA), whereby said terminal (TKA) is used to establish a voice connection with a partner (GEG) via a communications network (IPN, PSTN) at least over certain routes, using packet-oriented, connectionless data transmission. According to the invention, after a signalling step for establishing a connection from the telecommunications terminal (TKA) to the partner (GEG), information relating to the data to be displayed is transmitted by said partner (GEG) to the telecommunications terminal (TKA) via the communications network (IPN, PSTN), or the transmission of said information to the telecommunications terminal (TKA) is initiated by the partner (GEG). The received information is accepted and evaluated by the telecommunications terminal (TKA) and the data is optionally loaded onto the telecommunications terminal (TKA) and is output using at least one display element (BRO). The invention also relates to a corresponding system.
[origin: EP1326395A1] The method involves storing the address (ADDR) of information associated with a first user (T1) in the user's terminal or storing the association in the telecommunications network, reading the address when establishing a voice connection between the first and second users and sending to the second user (T2), receiving in the second user's terminal and using to request the associated information from the data network (DNET). AN Independent claim is also included for the following: a telecommunications network, a user terminal and a data medium.
