Abstract (en)
[origin: EP1462877A2] The mechanism has an indicator disc integrated to a pinion and indicating a tenth of a day. Another indicator disc integrated to another pinion indicates unit of the day. A crown includes primary and secondary inner teeth that cooperate with respective pinions for driving the pinions. The primary and secondary inner teeth arrest the teeth of the pinions to prevent the de-indexing of the pinions. An independent claim is also included for a clock component including a dial with large counter and a day display mechanism.
