Abstract (en)

[origin: WO03057588A1] A sealable dispenser device for dispensing a fluid, viscous or pasty medium, contained in a container is disclosed, comprising a dispensing opening (33), for dispensing the medium in the container and a closure device, by operation of which a connection between the dispensing opening (33) and the container may be produced or broken. The closure device is formed by an element which may be displaced along the connection between the dispensing opening and the container. Said dispensing device is characterised in that the closure device is embodied such that the above must be displaced onto the container in order to generate a connection between the dispensing opening (33) and the container and must be displaced away from the container in order to break the connection between the dispensing device and the container. Such a device is simple and easy to operate yet cannot open itself under any circumstances.
