Abstract (en)

[origin: WO03057596A1] During emptying of a temporary storage space (1) of a vacuum refuse collection system (10), the flow of a volume of a paper fraction (9) accumulated in the storage space is loosened by dividing it into separate streams. This division of the flow causes discharge of the accumulated paper fraction to be distributed over a slightly longer time, to further suppress any tendency to blockage in the passage of the paper fraction through a discharge valve (2).
