Abstract (en)

[origin: WO03060277A1] A retro-fit drive device (7), for a roller blind belt (5), comprises friction rollers (36) for driving the roller blind belt (5). A multi-speed gearset (19) is used to drive the friction rollers (36). The gearwheel (32) and the pinion (33) are spatially separate from each other on an intermediate gear in the gearset, such that a collection of toothed gears next to one plate (13) is avoided. A symmetrical run for a roller blind belt (5) between the plates can thus be achieved.
