Abstract (en)

[origin: WO03060853A2] The invention relates to a method for supplying a program-aided information system with specific positional information, according to which the information system provides at least one selection of defined positional information on the basis of a personalized or object-specific location which is detected by sensors. The inventive method is characterized by the following steps: acquiring positional data with respect to a personalized or object-specific location by means of sensors; translating the positional data acquired by sensors into a form that represents the location, said data being associated with a reference system within which the positional data are attributed to a location, and with a hierarchical structure; combining said location-representing forms to a location set and/or in the form of positional vectors in which the positional data of at least two locations are interlinked in a defined order; and/or establishing positional correlations and/or positional vector correlations between the locations and individuals or objects within so-called positioned location sets; and carrying out operations for determining a coincidence between locations as a basis for generating or providing location-dependent personalized or object-specific information.
